Project Overview

This is my internship project. I am building a website that helps people build a daily learning habit, similar in spirit to what platforms like [Duolingo](#) and [Blinkist](#) do, but simpler and built entirely from scratch with HTML, CSS, and JavaScript.

The core idea is straightforward: short, focused lessons are much easier to stick with than long and overwhelming study sessions. Most people quit learning not because they are lazy but because the process feels too big. This project tries to fix that by keeping everything small, clear, and encouraging.

The finished website will have seven main pieces working together:

- Onboarding to collect what the user wants to learn and how much time they have
- A lesson display section for showing daily learning content
- A streak tracker that records how many days in a row the user comes back
- A gamification layer with points, badges, and levels to keep motivation up
- A quiz and reflection section to test understanding after each lesson
- A content library that organises all lessons in one place
- A community sharing feature so users can post their progress if they want

Why This Project

The project exists because the problem it solves is real. People want to learn, but they often do not know where to start. When they do start, the process feels too big and they stop. What most people actually need is structure, encouragement, and consistency, not more content.

Short daily learning is easier to maintain than long sessions. A five-minute lesson done every day for a month beats a three-hour session done once. That is the mindset this project is built on.

How I Will Approach This

Rather than trying to build everything at once and getting completely lost, I am going to work in small focused chunks. Each piece of the site will be built to work on its own first. Once each part is working, I will link them together into the full platform at the end.

This approach keeps things manageable. It also means I will have something real to show at the end of every week, not just half-finished code that does not run.

I am planning for eight weeks in total. That gives enough time to build properly and still have room to fix things when they go wrong, because something always goes wrong.

Iteration Schedule

Week 1 – Onboarding

Goal: Get the user sign-up and goal-setting flow working.

This is the entry point to the whole website. The first screen a user sees needs to feel friendly and easy, not intimidating. I will build a simple form where someone picks what they want to learn and how much time they can spare each day.

Tasks

1. Build the HTML form with topic options and a daily time commitment selector
2. Style it with CSS to look clean and welcoming
3. Use JavaScript to save what the user picks to the browser's local storage
4. Add a simple confirmation screen after they submit

What success looks like: A user can pick their learning goal, hit submit, and see a confirmation. Their choices stay saved even after they refresh the page.

Week 2 – Lesson Display

Goal: Show the actual learning content and let users mark a lesson as done.

This is the core of the site. The lesson page needs to pull up the right content based on what the user picked during onboarding, and then let them say they finished it. For now the lessons will just be text stored in a JavaScript array, nothing complicated.

Tasks

5. Write a few sample lessons stored as objects in a JavaScript array
6. Build the lesson page that loads the correct lesson based on the user's chosen topic
7. Add a "Mark Complete" button
8. Save completion status to local storage so the site knows what has been done

What success looks like: A user can open their lesson, read it, click complete, and the site remembers that they finished it.

Week 3 – Streak Tracker

Goal: Track how many days in a row the user shows up.

Streaks are one of the main things that keep people coming back. The logic is simple: come back the next day and your streak grows. Miss a day and it resets. Simple, but effective.

Tasks

9. Record today's date whenever a user completes a lesson
10. Compare that date against their last completion date each time they open the app
11. Increase the streak if they came back the following day, reset it to zero if they missed one
12. Display the streak count somewhere prominent so it feels rewarding

What success looks like: Complete a lesson today, come back tomorrow and do another one, and the streak shows 2. Miss a day and it drops back to zero.

Week 4 – Gamification

Goal: Give users points for completing lessons and let them level up.

People like watching numbers go up. It sounds silly but it genuinely works. I will add a simple points system and a level structure based on total points earned.

Tasks

13. Award points for each completed lesson, starting at 10 points per lesson
14. Calculate and display total points somewhere visible on the page
15. Set level thresholds such as Level 1 at 0, Level 2 at 100, Level 3 at 250, and so on
16. Show the user's current level next to their points total

What success looks like: Complete a lesson, watch the points go up, and see the level increase when they cross a threshold.

Week 5 – Quiz and Reflection

Goal: Test understanding after each lesson.

Reading something is not the same as understanding it. After each lesson, I will add a short two or three question quiz to check if anything actually stuck. The lesson will only count as fully complete once the quiz is passed.

Tasks

17. Add a quiz section to each lesson page
18. Write simple multiple choice questions for the sample lessons
19. Score the answers and show feedback after each submission
20. Only mark the lesson fully complete if the user passes the quiz

What success looks like: Read a lesson, take the quiz, get at least half the answers right, and the lesson gets marked done.

Week 6 – Content Library

Goal: Show all available lessons in one place.

Users should be able to see the full picture of what is available, what they have done, and what is coming next. A library page gives them that overview without having to guess.

Tasks

21. Build a library page that pulls from the same lesson data used everywhere else
22. Show each lesson with a title and short description
23. Mark completed lessons visually, with a checkmark or a different colour
24. Lock or grey out lessons that have not been unlocked yet

What success looks like: A clean list or grid of lessons where the user can clearly see their progress and what comes next.

Week 7 – Community Sharing

Goal: Let users share their progress.

This does not need to be a full social media feature. Just a simple way for someone to share that they finished their lesson today. A copyable message or a downloadable badge is more than enough for now.

Tasks

25. Add a share button that copies a message like “I just finished my daily lesson on [topic]!” to the clipboard
26. Alternatively, generate a simple progress badge the user can save as an image
27. Keep it simple. No backend, no login, no actual social media integration

What success looks like: Click a button, copy the message, paste it wherever you want. That is it.

Week 8 – Polish and Integration

Goal: Make everything work together and look presentable.

This week is for finishing things properly. Linking all the pages together, fixing whatever broke along the way, and cleaning up the CSS so the whole site feels consistent. No new features, just making sure what exists actually works end to end.

Tasks

28. Link all pages with a consistent navigation bar
29. Test the full user journey from sign-up through lessons, streaks, quiz, and the library
30. Fix bugs where data does not save correctly or pages break
31. Clean up CSS across all sections for a consistent look and feel
32. Add simple error messages for when something goes wrong

What success looks like: A complete website where someone can go from signing up to finishing a lesson, seeing their streak and points, and browsing the library without anything breaking.

File Structure

Each section of the site lives in its own folder. This way, if something breaks, I only need to look in one place instead of searching through one huge pile of files.

What I'm Using

Just HTML, CSS, and plain JavaScript. No frameworks. The whole point is to actually understand what I am building rather than just stitching libraries together and hoping for the best.

For saving user data, I will use the browser's local storage. There is no real backend needed for this project, and local storage is more than enough to store things like the user's chosen topic, their streak count, and their completed lessons.

Personal Notes

This is my internship project. I am not trying to build the next Duolingo. I just need something that works, shows that I understand the different pieces, and could genuinely help someone build a small daily learning habit.

If something takes longer than expected, I will cut scope before I cut quality. A smaller project that actually runs is worth more than a bigger one that is half-broken.

I will also test things as I go instead of leaving everything to the end. The worst outcome would be finishing week 8 and discovering that week 2 was broken the entire time.
